

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The network protocol analyzer logs reveal that port 53 is unreachable due to ICMP response :'udp port 53 unreachable' when attempting to access the company website www.yummyrecipesforme.com. Port 53 is normally used for DNS traffic. This may indicate a problem with the DNS server or the firewall configuration. It is possible that the DNS server is down due to a DoS malicious attack.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: from 1:24 PM to 1:29PM

The incident occurred earlier today when the IT department received several calls from customers reporting that they were not able to access the client company website www.yummyrecipesforme.com, and saw the error "destination port unreachable" after waiting for the page to load. The IT department responded to the issue and began an investigation by running tests with the network protocol analyzer tool tcpdump. At approximately 1:24 PM to 1:29 PM The results of our tests concluded that port 53, which is used for DNS traffic, was not reachable. Our security engineers are continuing to investigate the incident in order to identify the source of the issue and restore access to the website. Our next step is to review the firewall configuration to see if Port 53 is blocked and contact the website's administrator to check the system for any signs of an attack. The IT Department believes It is most likely that the DNS server is down due to a DDoS attack.
